ALIGNMENTS

```
The present invention relates to use of mechano-growth factor (MGF),
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable
of reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
crescue. The MGF polynucleotide and polypeptide are useful in the
communicature of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
communicature of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
communicature of a medicament for the treatment of a neurological disorder.
CC any amyotrophic lateral sclerosis, spinal muscular atrophy,
communicative of motoneurone lesion or nerve damage, an
complement of the politic syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an
complement neuropathies, Alzheimer's disease and Parkinson's disease.
The present sequence is rabbit GF-I isoform MGF. MGF is a muscle
isoform having extracellular (EC) domain, hence also referred as
complement of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;
                 Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 60

mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                  A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. buchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a madicament for the treatment of neurological disorder. The MGF is capable of reducing motioneurone loss by 20% or greater in response to nerve avulsion, and effects motioneurone rescue, preferably adult motioneurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
               A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabbled 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver CDNA library. Insulinlike growth factors-IA and -IB CDNAS were isolated from a human CDNA library by using lambdagt 11 (AAN70435, AAN70436). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-I proteins. An essentially pure proproinsulin-like growth factor-I protein comprising the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       49 GPETLCGAELVDALQFVCGDRGFYFNKPIGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ΩD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                         including a disorder of motometrones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, peripheral neuropathies, Alzhelmer's disease and Parkinson's disease. The present sequence is human IGF-I isoform MGF is a muscle isoform having extracellular (EC) domain, hence also referred as IGF-I EC. The MGF protein comparises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                  The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 60

manufacture of medicament for the treatment of a neurological disorder, including a disorder of metoneurones and/or neurodegenerative disorder, including a disorder of metoneurones and/or neurodegenerative disorder, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone lesion or nerve damage, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. Progressit sequence is rat IGF-I isoform MGF. MGF is a muscle isoform having extracellular (Ec) domain, hence also referred as IGF-I-Ec. The MGF protein compatises amino acid sequences encoded by motoleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
The MGF polynucleotide and polypeptide are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                             of MGF.

Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder

Disclosure; Page 60-61; 66pp; English.

The present invention relates to use of mechano-growth factor (MGF),

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone cavilsion, and effects motoneurone rescue, preferably adult motoneurone careament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurological disorder, or any otrophic lateral sclerosis, spinal muscular atrophy, infantile or juvenile muscular atrophy, colimantal atrophy, infantile or juvenile muscular atrophy, colimantal atrophy, infantile or juvenile muscular atrophy, colimantal atrophy, and motoneurone trauma, a motoneurone lesion or nerve damage, and injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, cautosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rabbit liver-type IGF-I isoform (L.IGF-I).

The IndF-I protein comprises amino acid sequences encoded by and 6. ó; Note: The present sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to use of mechano-growth factor (MGF),
an Instlin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable
of reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
crescue. The MGF polymorlectide and polypeptide are useful in the
cmanufacture of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
cs. 9., amyotrophic lateral sclerosis, sphinal muscular atrophy,
cspinal muscular atrophy, infantile or juvenile muscular atrophy,
coliomyelitis or post-polio syndrome, a disorder caused by exposure to a
coliomyelitis or post-polio syndrome, a disorder caused by exposure to
coliomyelitis or post-polio syndrome, a disorder caused by exposure
coliomyelitis or post-polio syndrome, a disorder caused by exposure
coliomyelitis or post-polio syndrome, a disorder caused by exposure
coliomyelitis or post-polio syndrome, a disorder caused by exposure
coliomyelitis or post-polio syndromeurone loss associated with aging,
autosomal or sex-linked muscular dystrophy, diabetic neuropathy,
peripheral neuropathies, Alzheimer's disease and parkinson's disease.
The present sequence is human liver-type IGF-I isoform (L.IGF-I).
The LIGF-I protein comprises amino acid sequences encoded by
colour descular dystrophy and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                           mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the mature protein is terminated by a D domain at the C-terminus. The D domain sequence was used to synthesis peptides (AARB3801-2) that chains are separated by a C domain and induces and the IGF-1 receptor (IGF-1R) via the D domain and induces activation of the IGF-1R by autophosphorylation of the IGF-1R.

The synthetic peptides are useful as inhibitors of IGF-1 binding to IGF-1R and thus may be used in the treatment of disorders characterised by the synthesic peptides are useful as inhibitors of IGF-1 binding to by undesirable cell proliferation eg. cancer, restenosis, asthma, burns,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

This sequence is the human insulin-like growth factor I (IGF-I). The DNA can be used in the vector of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the clinker having a position for inserting the nucleic acid cassette, and sequence oding sequence of a gene with which it is naturally associated, and (d) a 3' flanking region, including a 3' untranslated region or a 3' non coding region on both, where the 3' flanking region is 3' to the position for inserting the nucleic acid cassette and comprises a sequence from a growth hormone 3' upr. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy. C diabetes, neuropathy, osteoporosis, and growth disorders. They can be used contracting peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Contracting peripheral neuropathies resulting from diabetes, and contracting peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type II or Type II diabetes, genetic disease such as Type II or Type II or Type II or Type II or Type I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      haemophilia, inflammation and side-effects from anti-cancer and anti-viral drugs. The vectors can also be used to create transgenic animals for research or livestock improvement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cardiovascular, cerebrovascular, or peripheral vascular disease,
                                 New vector for expression of insulin-like growth factor-I - containing a skeletal alpha-actin gene promoter, IGF-I coding sequences and a 3' region from growth hormone 3'-UTR
                                                                                                                                                                                                  Disclosure; Fig 13; 115pp; English

```
A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeleral muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ea isoform used in the present specification.
                                                                         Use of insulin like growth factor I characterised by presence of Ecpeptide - to treat humans or animals, particularly muscle disorders, heart conditions or neuromuscular diseases
                                                                                                                                                                                      Disclosure; Fig 4; 33pp; English.

                                                                                                                                                                                                                                                                                                                                         an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motomeurone loss by 20% or greater in response to nerve avulsion, and effects motomeurone rescue, preferably adult motomeurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motomeurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive toxin, motomeurone trauma, a motomeurone lesion or nerve damage, an injury that affects motomeurones, motomeurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, automice and autosomal adversarial content of the second progressive and the se

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            as SEQ ID NO:14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is alternative version of rabbit liver-type IGF-I isoform (L.IGF-I) The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.

Note: The present sequence is stated as being the same as SEQ ID NO:14 shown in sequence listing (AAE02452) of the specification. However
                                                                                                                                                          Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                           The present invention relates to use of mechano-growth factor (MGF),

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 10,

Nucleic Acids Res. 18:4275-4275(1990).
-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
                                                                                                                                          Cavia porcellus (Guinea pig).

Insulin family; Growth factor; Plasma; Signal; Alternative splicing.
     Blochim. Blophys. Acta 997:27-35(1989).

-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: 3 ISOFORMS, A, B (SHOWN HERE) AND C; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         INSULIN-LIKE GROWTH FACTOR I.
